Deductive reasoning starts with an understanding of a general principle, then special cases help support that principle. Inductive reasoning works the other way around, where a special case is observed first, which leads to the eventual understanding of a general principle.

Sections 1.1-1.3 Summary Inductive reasoning is a kind of logical reasoning which involves drawing a general conclusion, called a conjecture, based on a specific set of observations. In this process, specific examples are examined for a pattern, and then the pattern is generalized by assuming it will continue in unseen examples.

Inductive logic is more complicated and presupposes a grasp of deductive logic. That shouldn't be surprising: in a sense, deduction is just a special case of induction. A good inductive argument makes the conclusion likely to be true. If the premises guarantee that the conclusion is true, then that is maximally likely.

The chapter begins by explaining inductive and deductive reasoning. In hindsight, deductive reasoning depends on logic, which combines all the premises to get the ultimate result, which is the outcome or solution. It uses an absolute fact to build its conclusion. However, inductive reasoning ...
