Two solutions with the same osmotic pressure (same concentration of solutes) are said to be isotonic. Why must intravenous fluids be isotonic with your blood? Osmotic pressure is a colligative property of a solution. That is, its magnitude depends on the concentration of dissolved particles but does not depend on the nature of the dissolved particles. Interestingly, osmotic pressure  $(\pi)$  can be calculated using an equation that is very similar to the ideal gas equation:

Two colligative properties are related to solution concentration as expressed in molality. As a review, recall the definition of molality: Because the vapour pressure of a solution with a nonvolatile solute is depressed compared to that of the pure solvent, it requires a higher temperature for the solution's vapour pressure to reach 1.00 atm (760 torr).

Colligative properties are properties of solutions, that depend on the concentration of the dissolved particles (molecules or ions), but not on the identity of those particles. They often affect solvent properties like boiling and melting point, or the vapor pressure above a fluid. There are four colligative properties we will look at, which are:

A we have discussed, solutions have different properties than either the solutes or the solvent used to make the solution. Those properties can be divided into two main groups—colligative and non-colligative properties. Colligative properties depend only on the number of dissolved particles in solution and not on their identity.
