Therefore, a method to reliably distinguish between benign and malignant small solid pancreatic lesions would be highly desirable. We investigated the role of

Access Free Endoscopic

endoscopic ultrasound
(EUS) elastography in
this setting. Methods

Patients with solid
pancreatic lesions 15
mm in size and a
definite diagnosis were
included. Lesion stiffness
relative to the
surrounding pancreatic
parenchyma, as
qualitatively assessed
and documented at the
time of EUS

Endoscopy / Abstract
Endoscopic
ultrasonography (EUS)
and endobronchial
ultrasound (EBUS) have
largely replaced
mediastinoscopy for this
purpose. EUS is
routinely performed in
other settings such as

Access Free Endoscopic

esophageal cancer patients to enhance locoregional staging accuracy, partly through the use of fine-needle aspiration (FNA) for sampling malignant-appearing lymph nodes.

Endoscopic ultrasound
(EUS) is the best
imaging modality for
further evaluation of
SETs. However, it does

Access Free Endoscopic

not allow definite discrimination of benign from malignant lesions 2 3 . As larger SETs (> 3 cm) should rather primarily be resected due to their higher malignant potential, the optimal approach to smaller lesions (≤ 3 cm) remains inconclusive 4 .
