Geothermal energy has been harnessed for recreational uses for millennia, but only for electricity generation for a little over a century. Although geothermal is unique amongst renewables for its baseload and renewable heat provision capabilities, uptake continues to lag far behind that of solar and wind.

Geothermal Energy: Delivering on the Global Potential—Paul L. Younger 2015 After decades of being largely the preserve of countries in volcanic regions, the use of geothermal energy—for both heat and power applications—is now expanding worldwide. This reflects its excellent low-carbon credentials and its ability to offer baseload and dispatchable output – rare amongst the mainstream renewables. Yet uptake of geothermal still lags

(PDF) Geothermal Energy: Delivering on the Global Potential Geothermal energy is thermal energy produced naturally in the planetary interior [1,2], principally by the decay of radioisotopes of potassium, uranium and thorium . As such, it is the only renewable energy source independent of solar radiation and/or the gravitational attraction of the sun and moon [4]. Geothermal Energy: Delivering on the Global Potential

From a few practical considerations, a procedure has been developed for assessing the geothermal energy potential of abandoned underground coal mines, as well as for quantifying the reduction in CO₂ emissions associated with using the mines instead of conventional heating/cooling technologies. On this basis the authors have been able to estimate that the geothermal energy available from underground coal mines in Europe is on the order of several thousand megawatts thermal.
