Basement Membranes: Cell and Molecular Biology brings together the most important research developments of the past 45 years that have enriched our knowledge and contributed to a better understanding of the biochemistry and cell and molecular biology of basement membranes. It describes the studies that shed light on the ultrastructural organization, the biosynthesis of the macromolecular components, their functions in embryonic development and differentiation, and in the mature state. A major portion of the book is devoted to the description of the genes that regulate the expression of the various structural macromolecules. Reviews the early years of research and the discovery of type IV collagen Presents the diversity of basement membrane morphology Discusses gene structure

This masterful third edition of Freshney's Culture of Animal Cells updates and considerably expands the scope of its predecessor and still enables both the novice and the experienced researcher to apply the basic and more sophisticated techniques of tissue culture. New Topics covered include: the use of molecular techniques in cell culture, such as DNA fingerprinting, fluorescence in situ hybridization, and chromosome painting cell interactions in cell culture new methods for separating cells new or refined methods for accessing cytotoxicity, viability, and mutagenicity experimental details for culture of specialized cells types not covered in previous editions new or refined techniques for visualizing clues, including time-lapse photography and confocal microscopy The revised and expanded third edition offers the following features: over 350 new reference to the

Histology is the study of the microscopic structure of cells, tissues, and organs. It has often been taught as a matter of memorization. Dr. Van Lommel's approach is based on the understanding that the microscopic structure of the body has a logic, and the text and accompanying images are organized to proceed according to a rigorous logic, expanding from the anatomy and morphology to discuss the functions of the various kinds of cells, tissues, and organs. The material is thus more interesting and, as an extension of that, easier to remember. CD-ROM included.

This is the leading textbook for medical histology and microscopic anatomy courses. It features an updated description of the structure and function of cells and the function and specialization of the four tissue groups: epithelial, connective, adipose, and nerve. Chapters on the cytoplasm and cell nucleus are updated to include the most recent discoveries on cell biology. It also describes the
