A circuit is a closed path which allows electricity to flow from one place to another, usually including the source for the electricity. Circuits can be made up of various electrical components that use electricity, but the flow of the electricity itself will be unimpeded from the source to the end (known usually as the ' ground ').

In Simple terms an electronic circuit is a closed pathway for electrons to flow. The Electric Current in a circuit flows from positive to negative while electrons flow from negative to positive. So when the switch is on the path is complete and electricity passes through enabling the bulb to light up, while when the switch is not on, there is a break in the flow of electricity and the bulb does not light up.
